Sublication No. US20030165478A1
GENERAL INFORMATION:
APPLICANT: Sokoll, Kenneth K.
TITLE OF INVENTION: Stabilized Synthetic Immunogen Delivery System
FILE REFERENCE: Immunogen Delivery System
CURRENT APPLICATION NUMBER: US/10/076,674
CURRENT FILING DATE: 2002-04-23
NUMBER OF SEQ ID NOS: 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2 HWSYGLRPGSSGPSL-----KLLSEIKGVIVHRLEGVEGPSLHWSYGLRP 46

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FEATURE:
ORGANISM: Artificial Sequence
FEATURE:
ORGANISM: Artificial Sequence
FEATURE:
ORGANISM: Artificial Sequence
FEATURE:
OTHER INFORMATION: Chimeric peptide consisting of amino acid sequence 1-10 of human of the information: Inm falciparum circumsporozoite (CSP) protein
OTHER INFORMATION: Ium falciparum circumsporozoite (CSP) protein
NAME/KRI: MOD_RES
LOCATION: (1)...(1)
OTHER INFORMATION: Pyroglutamic acid or 5-oxoproline
NAME/KRI: MOD_RES
LOCATION: (51)...(51)
OTHER INFORMATION: Amidated glycine or glycinamide
NAME/KRI: PEPTIDE
LOCATION: (1)...(10)
OTHER INFORMATION: Spacer peptide
NAME/KRI: PEPTIDE
LOCATION: (1)...(16)
OTHER INFORMATION: Circumsporozoite (CSP) protein
NAME/KRI: PEPTIDE
LOCATION: (17)...(36)
OTHER INFORMATION: Circumsporozoite (CSP) protein
NAME/KRI: PEPTIDE
LOCATION: (37)...(42)
OTHER INFORMATION: Spacer peptide
                                                 NAME/KET: PEPTIDE

COTHER INFORMATION: (17). (31)

COTHER INFORMATION: (Tentoxylysin)

NAME/KEY: PEPTIDE

LOCATION: (32)...(37)

NAME/KEY: PEPTIDE

NAME/KEY: PEPTIDE

NAME/KEY: PEPTIDE

COTHER INFORMATION: Spacer peptide

NAME/KEY: PEPTIDE

COTHER INFORMATION: (38)...(46)

COTHER INFORMATION: Amino acid sequence 2-10 of the human GnRH hormone
US-09-848-834A-19

OTHER INFORMATION: Chimeric peptide made up of amino acid sequence 288-302 of the OTHER INFORMATION: asels virus fusion protein, F linked by a spacer peptide to am OTHER INFORMATION: acid sequence 2-10 of the GRRH hormone
                                                                                                                                                                                                                                                                                                                                          LOCATION: (1)..(1)
OTHER INFORMATION: Amidated Lysine
NAME/KEY: PEPTIDE
LOCATION: (1)..(15)
OTHER INFORMATION: Peptide corresponds to the amino acid sequences 288-302 of the
NAME/KEY: PEPTIDE
NAME/KEY: PEPTIDE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FEATURE:
OTHER INFORMATION: Chimeric peptide consisting of amino acid sequence 1-10 of hum
OTHER INFORMATION: Chimeric peptide consisting of amino acid sequence 1-10 of hum
OTHER INFORMATION: GRAH linked by a spacer to amino acid sequence 830-844 of Teta
OTHER INFORMATION: toxoid precursor (Tentoxylysin) linked by a spacer to amino acid OTHER INFORMATION: sequence 1-10 of GRAH
LOCATION: (1)...(1)
OTHER INFORMATION: Pyroglutamic acid or 5-oxoproline
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             : LOCATION: (23)...(31)
: OTHER INFORMATION: Peptide corresponds to amino acid sequences 2-10 of the human
: OTHER INFORMATION: GNRH hormone
: NAME/KEY: MOD_RES
: LOCATION: (31)...(31)
: OTHER INFORMATION: Amidated glycine or glycinamide

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mative sequence is replaced by a T-cell epitope such as P30, with mainfinal disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDFP waccines can be used to treat human diseases such as cancer cachexia where muscle atrophy is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of AutoVac construct GDF-8 P30-3B, comprising the 109 C-terminal amino acid residues of human growth differentiation factor 8 (GDF-8) in which residues 84-104 are replaced by the promiscuous tetanus toxin T-cell epitope P30 (See AAB20144). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8B). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dalum I;

ingrand (OpGU) and tetahus toxoid Paloen by Intiline Sieverprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OpGU protein is synthesised as a type II transmembrane protein. The murine and human OpGL polypeptides are 87% homologous. OpGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OpGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OpGL polypeptide or subsequence, and/or at least one OpGL analogue to induce an immune response in the animal. The method and OpGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence represents fusion protein of murine osteoprotegerin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     In vivo down-regulation of osteoprotegerin ligand (OPGL) activity used to treat, prevent and ameliorate osteoporosis -
                                                                                                        An osteoprotegerin ligand/tetanus toxoid P30 epitope fusion protein.
                                                                                                                                                  Osteoprotegerin ligand; OPGL; osteoprotegerin; osteoclastogenesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of AutoVac construct GDF-8 P30-2, comprising the 109 C-terminal amino acid residues of human growth differentiation factor 8 (GDF-8) in which residues 49-69 are replaced by the promiscuous tetanus toxin T-cell epitope P30 (see AAB20144). It is an object of the invention to produce a cecombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the minimal disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 cotivity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibution where the contract contracts and production in the contract contracts and poultry used for meat production, reducing the need for antibution where the contract contracts and poultry used for meat production, reducing the need for antibution the contract contracts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 treat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Immunogenic analogues of WUC-1 and, e.g. human prostate active contained method as an eutovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms (see features table). It regions suitable for the insertion of foreign T helper epitopes were identified. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. hPSM, heregulin 2 (Her2) and/or fibroblast growth factor 80 (FFRB). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic cell group proteins) are paralogues of human PSM, human cell group which is foreign to the animal. Analogues of human PSM, human and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is the contract when the PA is

antigen (PSM) constructs, which contain foreign epitopes (P2 and/or antigen (PSM) constructs, which contain foreign epitopes (P2 and/or as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteline residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), eregulin 2 (Herz) and/or fibroblast growth factor BV (FGRBD). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-1ymphocyte) group derived from the PA and/or at least 1 E cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and human/murine FGRBb comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least prostate, prostate/breast or breast cancer the method is used to treat prostate, prostate/breast or breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAY92627-49 are mutant immunogenized human prostate specific membrane

                                                                                                                           The present sequence is that of AutoVac construct GDF-8 P30-3A, comprising the 109 C-terminal amino acid residues of human growth differentiation factor 8 (GDF-8) in which residues 79-99 are replaced by the promiscuous tetanus toxin T-cell epitope P30 (see AAB20144). It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    native sequence is replaced by a T-cell epitope such as P30, with mainfand disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, paiss and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF8 vaccines can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mutant human prostate specific membrane antigen construct, hPSM1.10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pronounced and for patients suffering from acute and chronic heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4;

                                                                                                                                                                                                                                                                                                                                                                as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated for self-proteins, e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor BB (FGFBB). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the PA and/or at least 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human PSM, human Her2 and human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed.
                                                                                                                                                                                                                                                             AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and human/murine FGF8b comprising a substantial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively.

Note: This sequence was constructed from the wild type human PSM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                       Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mucin repeat; MUC-1 analogue; vaccination; self-protein; cancer; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope.

immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is a synthetic immunogen of the invention.
as luteinising hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic

The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other synaecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody tirres. The present sequence is a synthetic immunogen of the invention.
luteinising hormone releasing hormone; LHRH; contraceptive; promiscuous helper T-cell peptide epitope; immunominic peptide epitope; breast cancer; uterine cancer; gynaecological cancer; endometriosis; uterine fibroid; benign prostatic hypertrophy; prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                    "Other= Pyro-glutamic acid or 5-oxo proline"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gonadotropin releasing hormone, comprises fusion peptide having

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                    Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide
```

NAME OF THE PROPERTY OF THE PR

```
antibodies against gonaddropin releasing hormone (GRRH also Known as lutein. Single hormone releasing hormone. LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GNRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), endometriosis, uterine fibroids, benign prostatic hippertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GRRH antibody titres. The present sequence is a synthetic immunogen of the invention.
                                                                                                        luteinising hormone releasing hormone; LHRH; contraceptive; promiscuous helper T-cell peptide epitope; immunomimit peptide epitope; breast cancer; uterine cancer; gynaecological cancer; endometriosis; uterine fibroid; benign prostatic hypertrophy; prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a synthetic immunogen for inducing specific
                                                                                                                                                                                                                                                                                           "Other= Pyro-glutamic acid or 5-oxo proline"

Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytocoxic T lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th) which elicits an immune response to the coupled peptide in members of a heterogeneous population expressing diverse HIA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yersinia. Spacer amino acid sequences (e.g. Gly-Gly) can be provided between the invasin and Th domains and between the immune stimulator and hapten components. When the hapten is LHSH, then optionally the invasin domain can be omitted from the immune stimulator component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treating e.g. prostatic hyperplasia, androgen-dependent carcinoma, prostatic carcinoma, testicular carcinoma, endometriosis, benign uterine tumours, recurrent functional ovarian cysts, (severe) premenstrual syndrome or oestrogen-dependent breast cancer, or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents an LHRH-containing, invasin-free immunogenic peptide as above which can be used as a potent vaccir
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunogenic luteinising hormone releasing hormone peptide(s)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a synthetic immunogen for inducing specific antibodies against gonaddiropin releasing hormone (GRH also known as luteinising hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunomimic peptide epitope or its analogue. The synthetic analogue, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other synaecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GRHH antibody titres. The present sequence is a synthetic immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Helper T cell epitope; universal immune stimulator; invasin; hapten; vaccine; LHRH; luteinising hormone releasing hormone; prostate; androgen-dependent carcinoma; antitumour; infertility; tetanus toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel synthetic immunogen for inducing immune response against gonadotropin releasing hormone, comprises fusion peptide having promiscuous helper T-cell peptide epitope and immunomimic peptide
                                                                                                                                                            "Gonadotrophin releasing hormone epitope"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                peptide which comprises a promise course helper T-cell peptide epitope and immunomninic peptide epitope or its analogue. The synthetic immunomninic peptide epitope or its analogue. The synthetic immunomninic manner as against GRRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other typaraccological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GRRH antibody tires. The present sequence is a synthetic immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gonadotrophin releasing hormone, GnRH; synthetic immunogen, luteinising hormone releasing hormone; LHRH; contraceptive; promiscuous helper T-cell peptide epitope; immunomimic peptide epitope; breast cancer; uterine cancer; gynaecological cancer; endometriosis; uterine fibroid; benign prostatic hypertrophy; prostate cancer.
                                                                                                                                                                                                                                                                                                               The invention relates to a synthetic immunogen for inducing specific antibodies against gonadotropin releasing hormone (GnRH also known as luteinising hormone releasing hormone, LHRH) comprising a fusion

The synthetic immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immuno response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GRRH antibody titres. The present sequence is a synthetic immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gonadotrophin releasing hormone; GnRH; synthetic immunogen;

RESULT 1 AAU11429

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Nuclectide sequences of the fusion protein gene of subacute
"Nuclectide sequences of the fusion protein gene of subacute
sclerosing panencephalitis viruses: deduced amino acid sequences
showed the cytoplasmic donain highly mutated --truncated, elongated or
predicted secondary structure changed.";
Submitted (AUG-1999) to the EMBL/GenBank/DDBJ databases.
